There are two essential steps of limb salvage, including resection and reconstruction. Resection is crucial to the elimination of disease. It should include excision of previous biopsy sites and tracts with at least a 2 cm margin. All major vessels should be identified prior to ligation.

### **Osteosarcoma: a comprehensive review - PMC**

The vast majority of patients (about 85 to 90%) with osteosarcoma undergo limb salvage. Limb salvage involves the removal of a tumor from a limb without the removal of the entire limb itself. This process occurs in two main steps: initial resection and subsequent reconstruction. Resection is essential for the elimination of the disease.

A time-calibrated phylogeny and ancestral area reconstructions confirmed the Paleocene origin of SA *Cnemaspis* in the WG and provide insights into its evolutionary history and biogeography. The discovery of multiple endemic and deeply divergent lineages further highlights the evolutionary significance of the WG for lizards.
