Huygens theory was the successful theory of light wave motion in three dimensions. Huygen, suggested that light wave peaks form surfaces like the layers of an onion. In a vacuum, or other uniform mediums, the light waves are spherical, and these wave surfaces advance or spread out as they travel at the speed of light.

### Theory of Light

Discussion introduction. Light is a transverse, electromagnetic wave that can be seen by the typical human. The wave nature of light was first illustrated through experiments on diffraction and interference.Like all electromagnetic waves, light can travel through a vacuum.

The experiment compared the speed of light in perpendicular directions in an attempt to detect the relative motion of matter through the stationary luminiferous aether ("aether wind"). The result was negative, in that Michelson and Morley found no significant difference between the speed of light in the direction of movement through the presumed aether, and the speed at right angles.

The main draw of most motion-activated lights is the sensors themselves, but one motion sensor light might have a different range compared to another. A short-ranged sensor is fine for compact spaces or smaller areas, but the larger a space gets (especially if it is outdoors), the harder it will get to cover everything.
